young stars

# quiescent gas disk in an early-type galaxy from WISDOM

## NGC4426

Davis et al. (2018), Liu et al. (2021), Lu et al. (2025)

central ~700 pc<sup>2</sup>  
rotating gas disk

217 clouds @ ~12pc resolution:  
 $\langle \log (\Sigma_{\text{mol}} / M_{\text{sun}} \text{pc}^{-2}) \rangle \approx 2.3$   
 $\langle \Sigma \sigma \rangle \approx 5 \text{ km/s}$

no massive star formation (H $\alpha$ , BPT)  
 $\text{SFR} < 0.1 M_{\text{sun}} \text{yr}^{-1}$

# Why are no (high-mass) stars forming in some gas-rich centers?

## suggestions for mechanisms inhibiting star formation:

- disk pressure stabilises against collapse
- tidal disruption of ‘clouds’
- shearing of ‘clouds’, shear-induced turbulence
- higher gas density threshold (as proposed for MW CMZ)
- magnetic fields
- heating by cosmic rays, AGN ?
- ...

### How can we test these?

central  $10 \times 10 \text{ kpc}^2$   
deprojected, i.e. face-on  
 $7.7 \mu\text{m}$  PAH emission  
(tracing both SF and cold neutral ISM, e.g., Leroy+23)  
all barred galaxies  
low to high stellar mass
