

The QSO–morphology connection

**Is there one?
and: do we care?**

Or: way too much fame for bulges and mergers?

Knud Jahnke (MPIA)

+ Katherine Inskip, Matt Mechtley, Liyu Ambachew (MPIA),
Mauricio Cisternas (IAC), John Silverman (IPMU) + COSMOS

The role of QSOs

- AGN feedback?

- Maintenance (=radio) mode:
 - in clusters, ok, elsewhere?
- Quenching (=QSO) mode:
 - ??? → dependency on M, env., z?

- Conditions for QSO activity?

- Environment → non-cluster
- Mass
- Morphology → what about bulges?

What are the ...

... properties of AGN (QSO) host galaxies?

... conditions for fueling massive Black Holes?

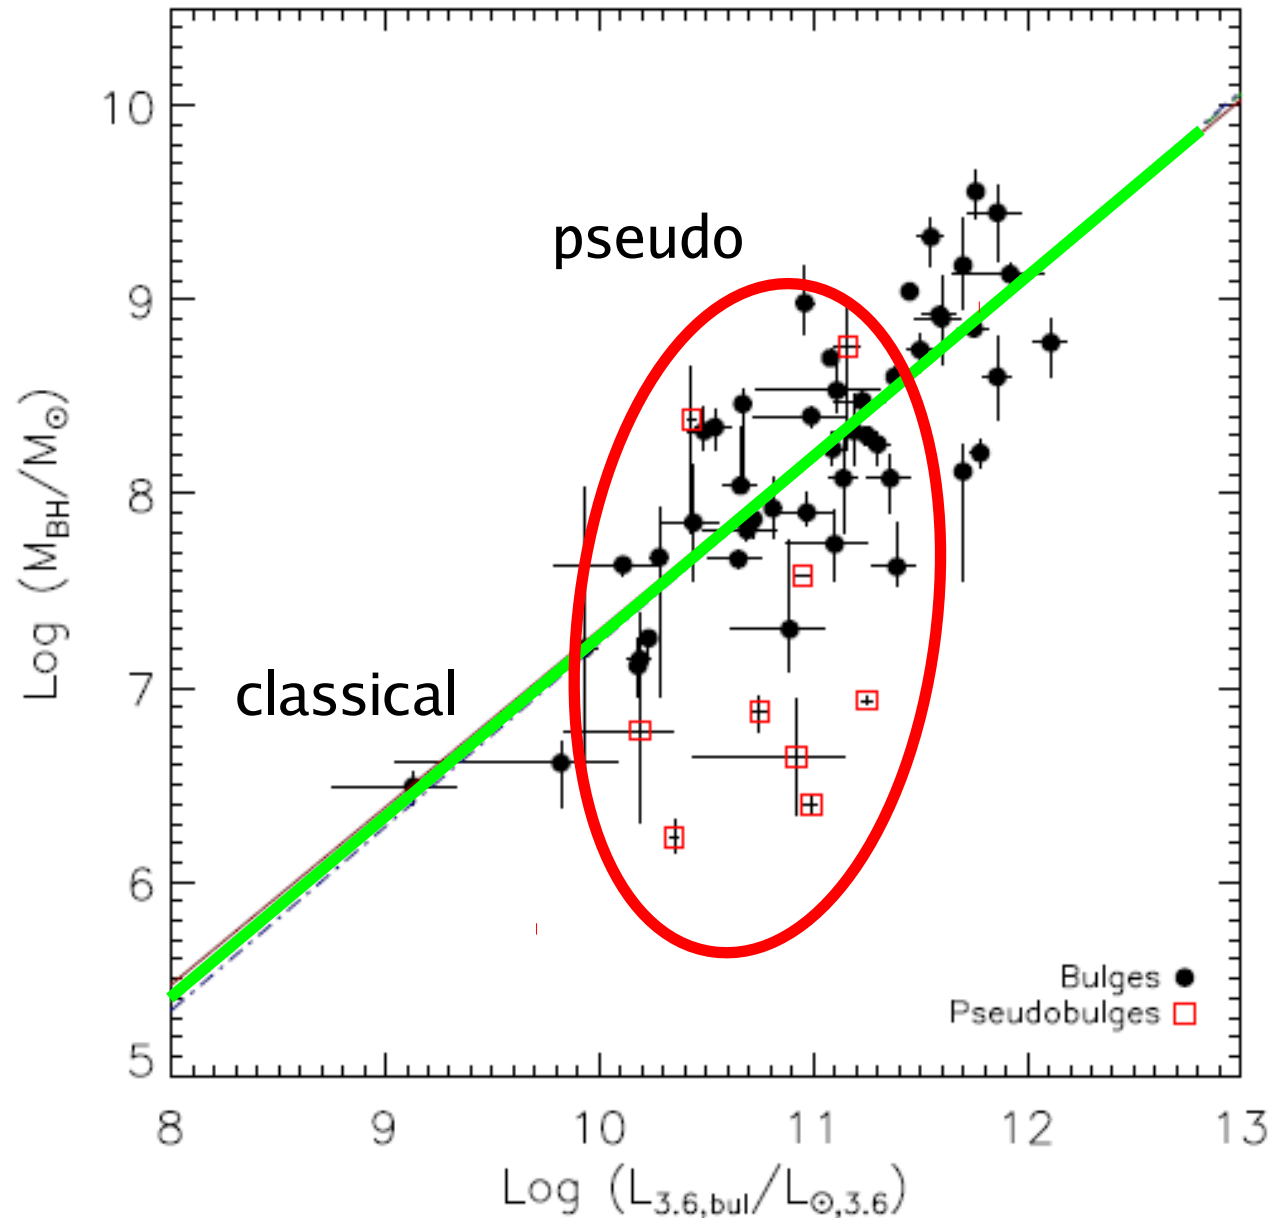

Fundamental pitfall

xkcd.com/552

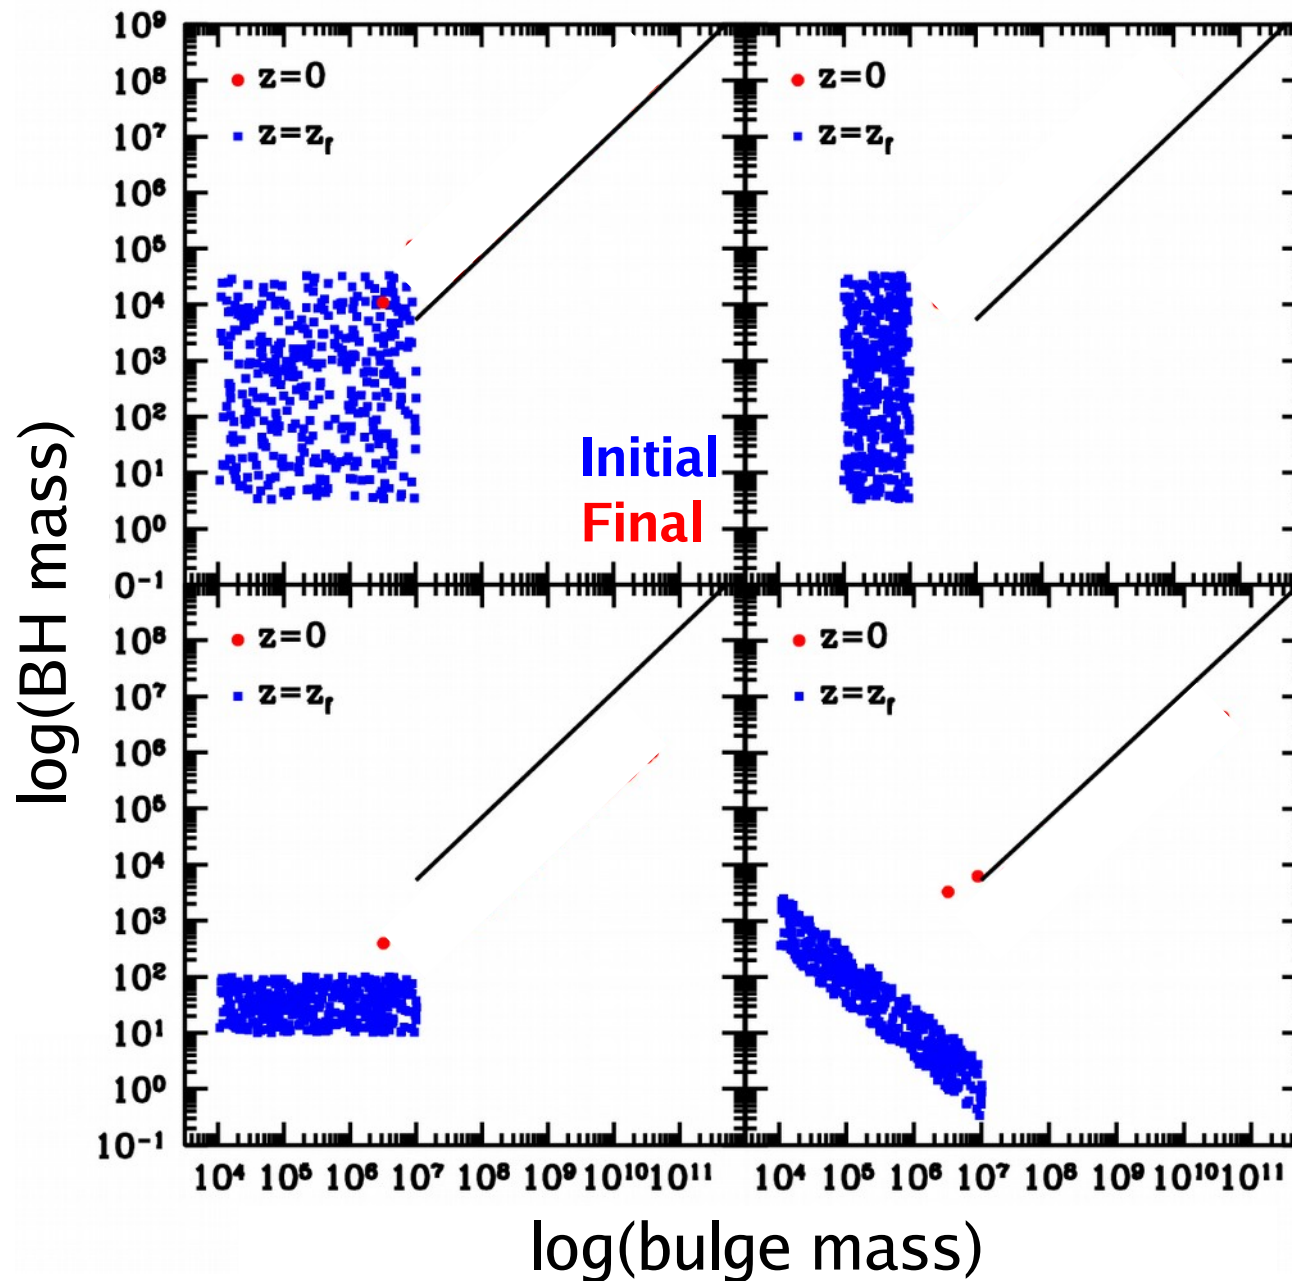

BH–galaxy scaling relations

Sani+ 2011

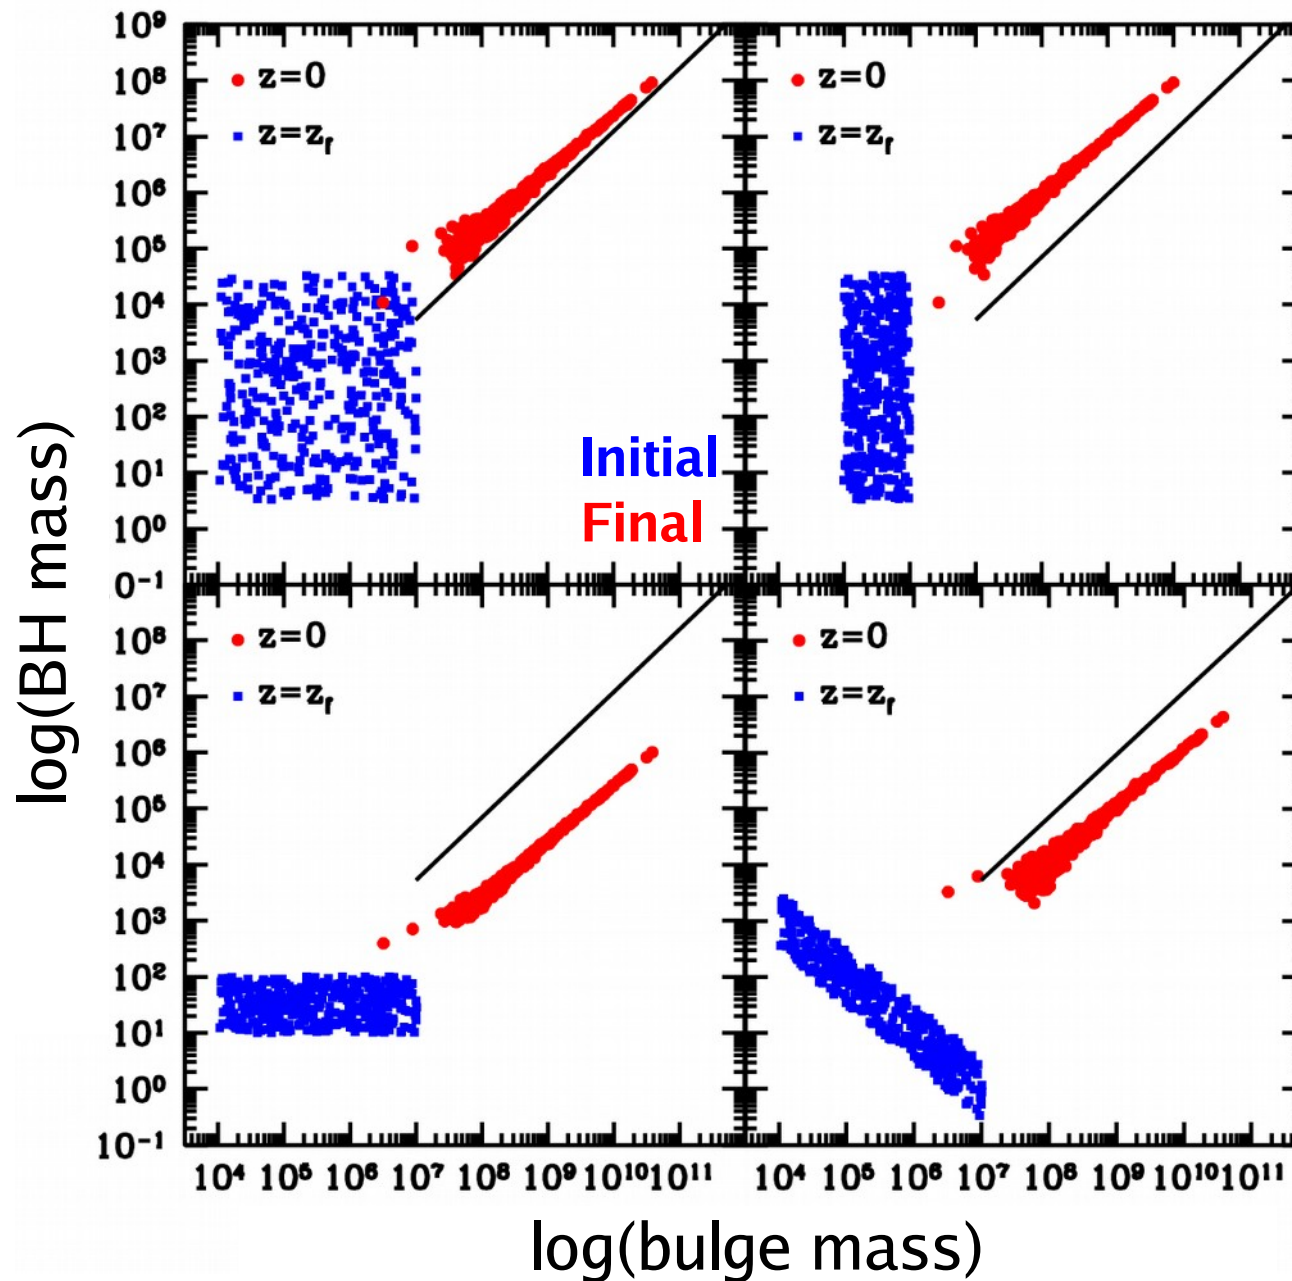

BH–galaxy scaling relations

KJ & Maccio 2011
(see Peng 2007)

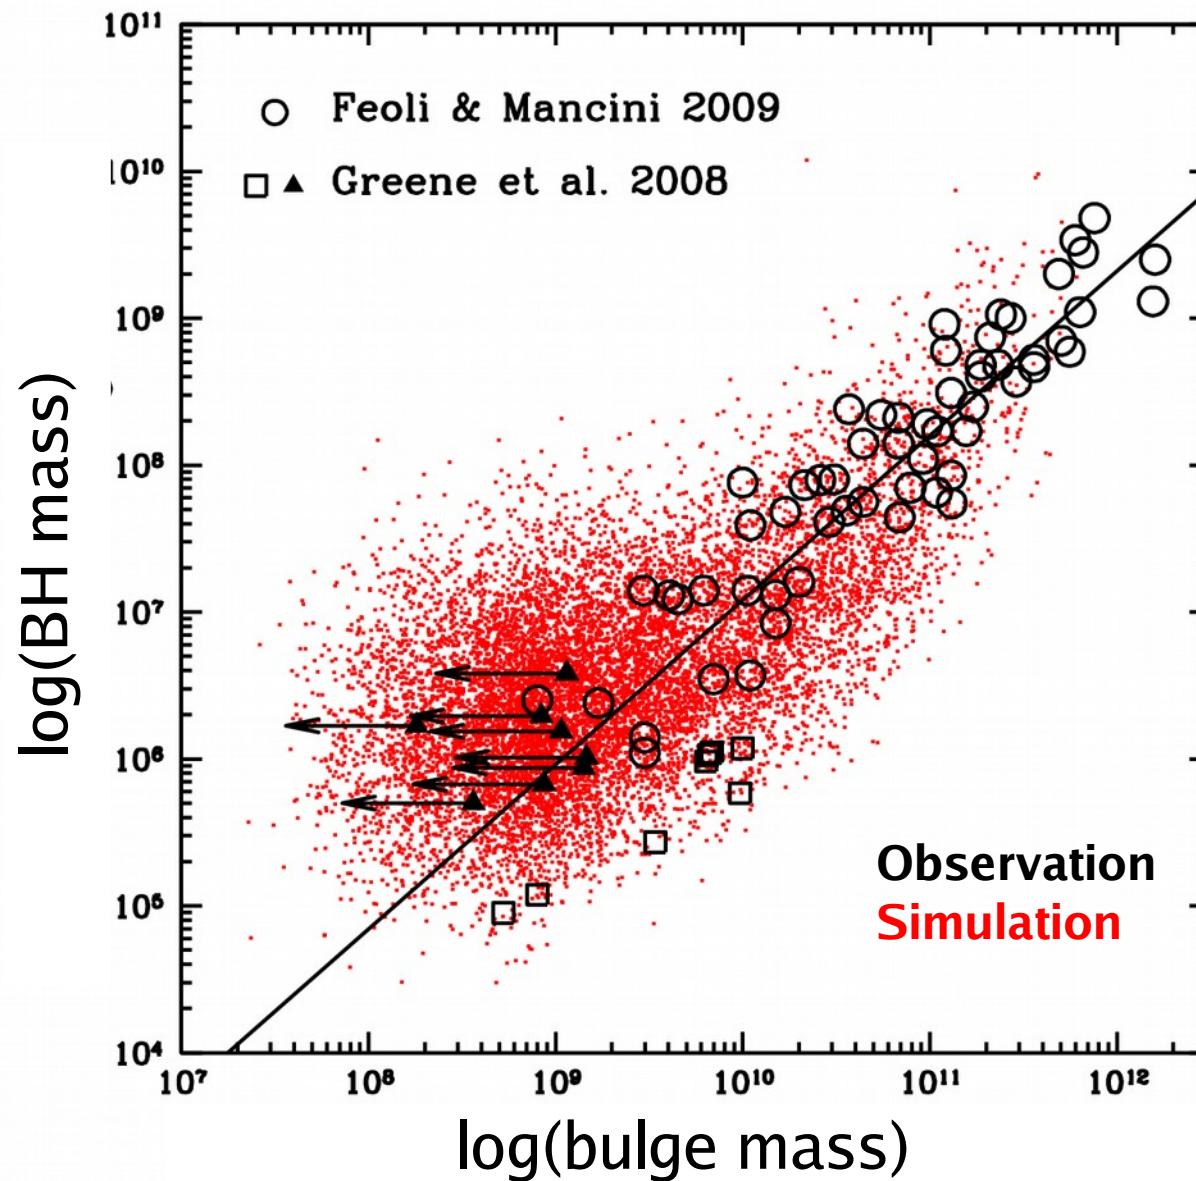

BH–galaxy scaling relations

KJ & Maccio 2011
(see Peng 2007)

BH–galaxy scaling relations

KJ & Maccio 2011

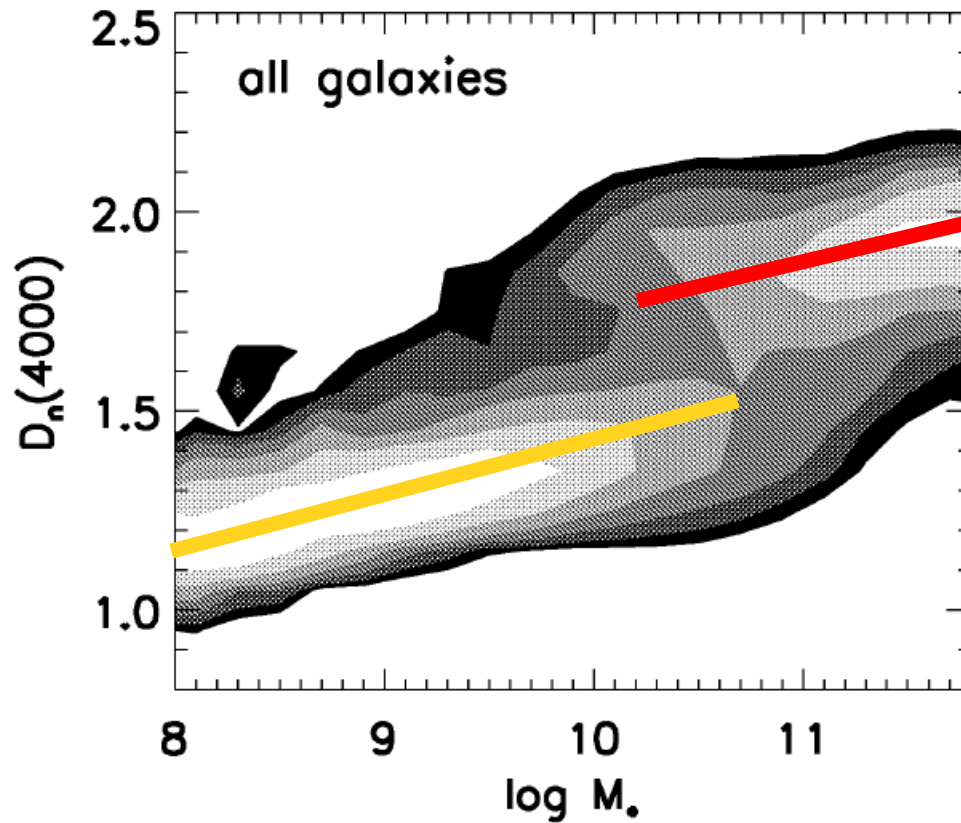

BH–galaxy scaling relations

- What does this mean?
 - BH scaling relations consequence of LCDM assembly
 - No feedback needed
 - Modification by self-regulation and normalization → open
 - Historical misunderstanding: all BH fueling recipes successful
- In Q+Q context: *The bulge is not (necessarily) an active player*

No AGN–starburst relation

Type 2 AGN, Kauffmann+ 2003

Luminous AGN: same stellar ages as SF galaxies

No AGN–starburst relation

KJ+ 2004a,b; Sanchez, KJ+ 2004

$z \sim 0.1$
col-mag

$0.4 < z < 1.3$
col-z

$1.7 < z < 2.5$
col-z

+Herschel (Santini+ 2012):

Luminous AGN are normal SF galaxies, not starbursts

What are the ...

... properties of AGN (QSO) host galaxies?

... conditions for fueling massive Black Holes?

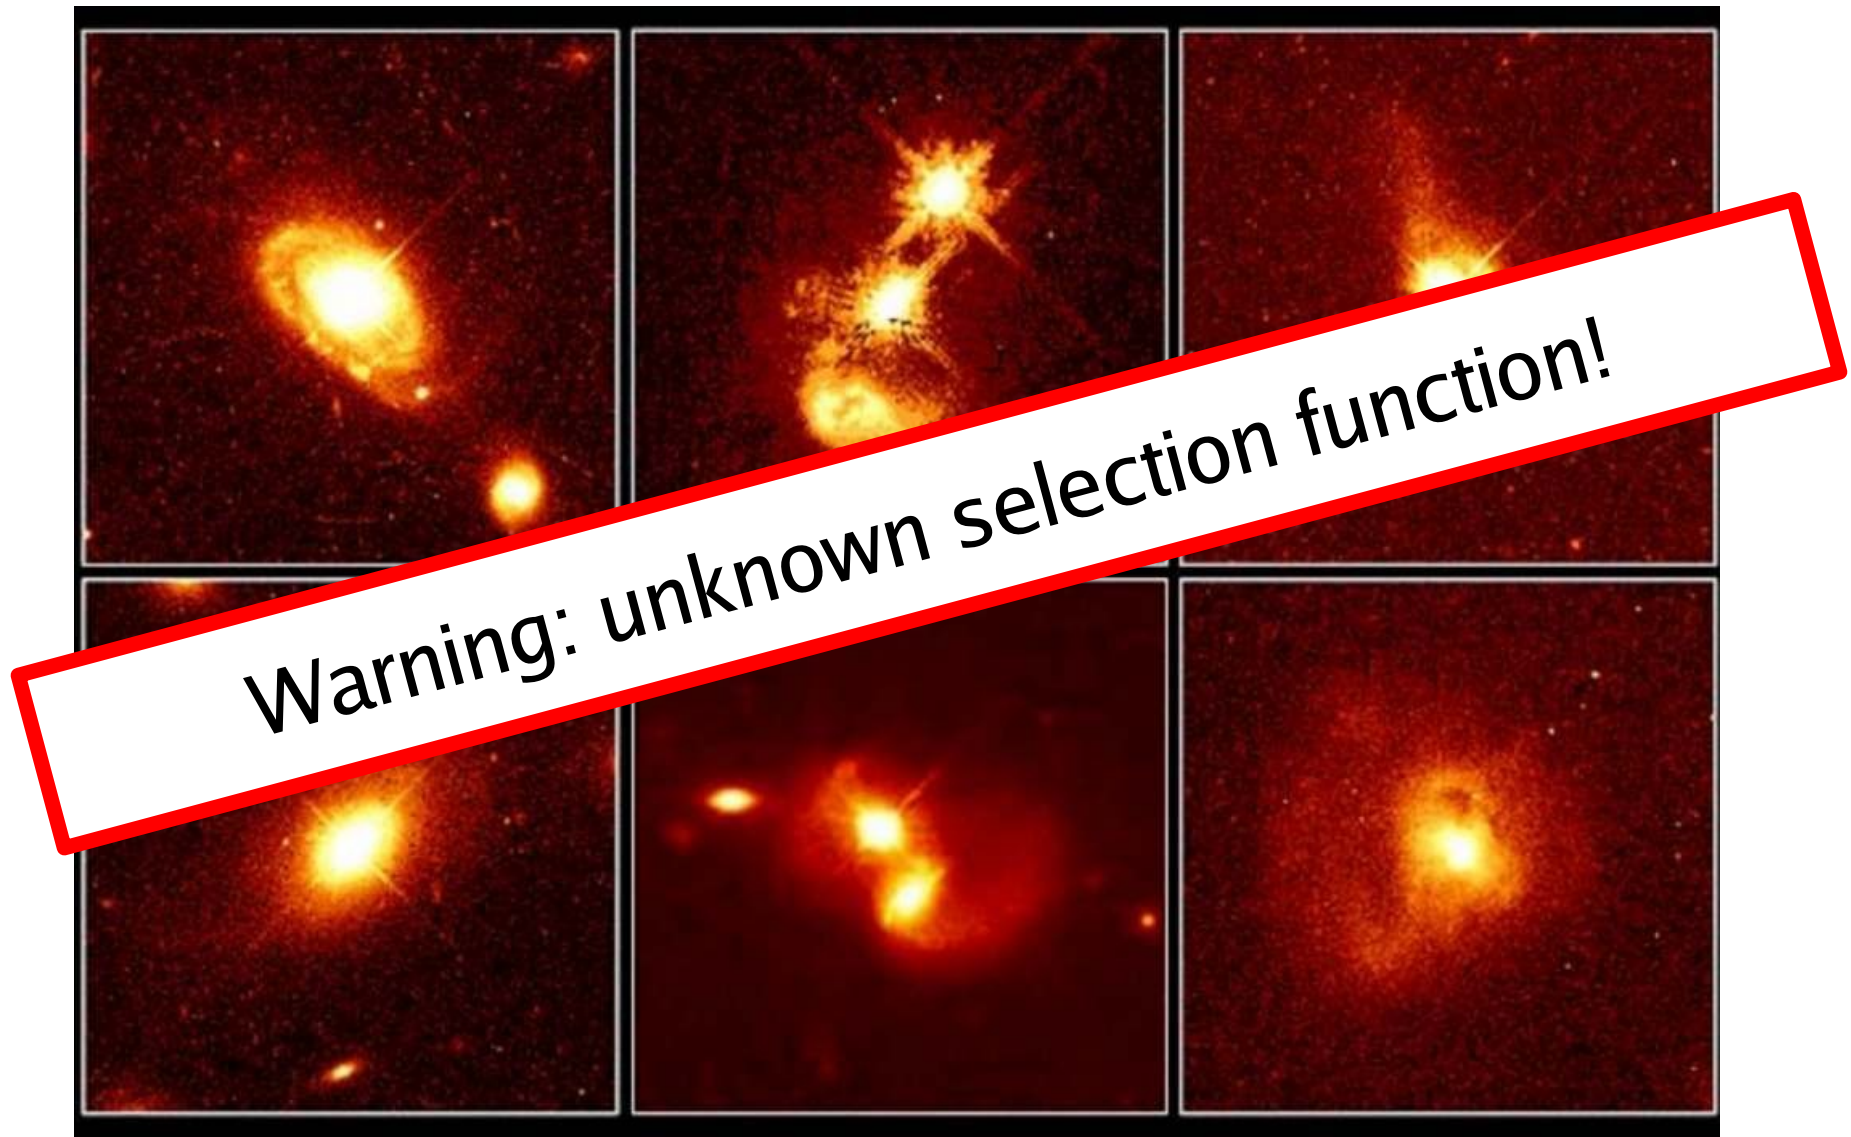

How to feed a monster BH

- Presence of gas → see SF
- Need for a “trigger”?
 - Favorite mechanism: major merging
 - SAMs → Rachel S.
 - SPH → Di Matteo/Phil H./Springel
 - Analytics → Andrew K.

QSOs = Major Merging?

QSO host galaxies, HST: Bahcall+ 1997

QSOs = Major Merging?

Low-z, high mass: P91, VLT/FORS, 0.6", 28 QSOs $\log M_{\text{BH}} \sim 9.0$
+ 28 comparison galaxies

HE 1514-0606,
 $\log M_{\text{BH}} = 8.9$

inactive

inactive

Ambachew, KJ+, in prep.

QSOs = Major Merging?

$z=2$, high mass: HST WFC3/IR, 19 QSOs, $\log M_{\text{BH}} \sim 9.5$

QSO

QSO

inactive

Mechtley, KJ+, in prep.

QSOs = Major Merging?

AGN: >50% disks
(massive end: open)

COSMOS $z < 1$: Cisternas, KJ+ 2011
(see also Kocevski+ 2012,
Schawinski+ 2011/12)

QSOs = Major Merging?

QSOs = Major Merging?

- In brief:
 - $z < 2$: many many disk host galaxies
 - $z < 1$: $< \sim 25\%$ of BH accretion due to merging
 - $z \sim 2$: no merger triggering for lower-L half of BH accretion

QSOs = Major Merging?

- Further diagnostics:
 - Close pairs (Silverman+KJ+ 2011, Ellison+ 2011, Lackner+KJ+ 2014)

QSOs = Major Merging?

COSMOS/HST: Silverman, Kampczyk, KJ+ 2011

QSOs = Major Merging?

- In brief:
 - $z < 2$: many many disk host galaxies
 - $z < 1$: $< \sim 25\%$ of BH accretion due to merging
 - $z \sim 2$: no merger triggering for lower-L half of BH accretion

→ *Most of BH accretion not triggered by major merging*

So?

→ QSO phase \neq morphology change phase

→ modelers?

For AGN/QSOs...

- ...the bulge is not (necessarily) an active ingredient
 - if you still want this, find a first principle reason, please!
- ...host galaxies are normal starforming galaxies
 - no AGN–starburst connection; avoid ULIRG–QSO picture
- ...major merging is subdominant for AGN at $z < 2$
 - so why is this still in models?
